SEMI-FINISHED LENS

What's the importance of a good semi-finished lens to RX production?..

- High qualified rate in power accuracy and stability
- High qualified rate in cosmetics quality
- High optical features
- Good tinting effects and hard-coating/AR coating results
- Realize the maximum production capacity
- Punctual delivery

Not just superficial quality, semi-finished lenses are more focus on the internal quality, such as precise and stable parameters, especially for the popular freeform

The Advantages Of Progressive Lenses.

--With progressive lenses, you won't need to have more than one pair of glasses with you. You don't need to swap between your reading and regular glasses.

---Vision with progressives can seem natural. If you switch from viewing something up close to something far away, you won't get a "jump" like you would with bifocals or trifocals. So if you're driving, you can look at your dashboard, at the road, or at a sign in the distance with a smooth transition.

---They look like regular glasses. In one study, people who wore traditional bifocals were given progressive lenses to try. The study's author said most made the switch for good.

AR Coating.

--HC(hard coating): To protect the uncoated lenses from scratch resistance

--HMC(hard multi coated/AR coating): To protect the lens effectively from reflection, enhance functional and clarity of your vision

--SHMC(super hydrophobic coating): To make the lens waterproof, antistatic, anti slip and oil resistance.

Outstanding Color Performance..

- 1.Fast speed of changing, from white to dark and vice versa.
- 2.Perfectly clear indoors and at night, adapting spontaneously to varying light conditions.
- 3.Very deep color after change, the deepest color can be up to 75~85%.
- 4.Excellent color consistency before and after change.
