

PROJECT PRODUCTS

Drywall Metal framing

Advantages

Drywall metal framing is the process of constructing a metal or wood frame to which drywall sheets are attached to create interior walls and ceilings. Unlike traditional lath and plaster techniques, Metal drywall framing offers a faster, more cost-effective method for dividing spaces and creating smooth surfaces. The frame provides the structural support needed for the drywall panels, ensuring they are securely fixed and properly aligned.

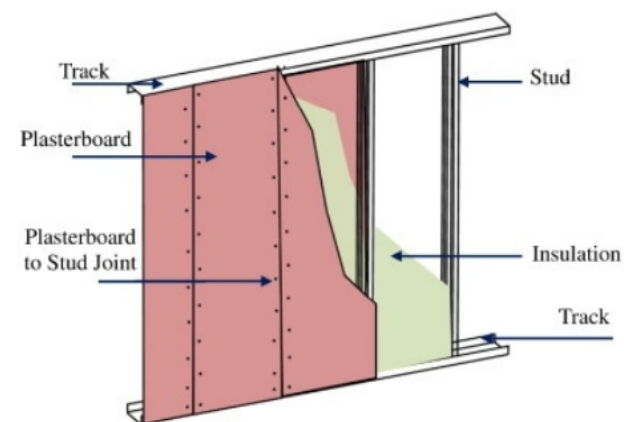

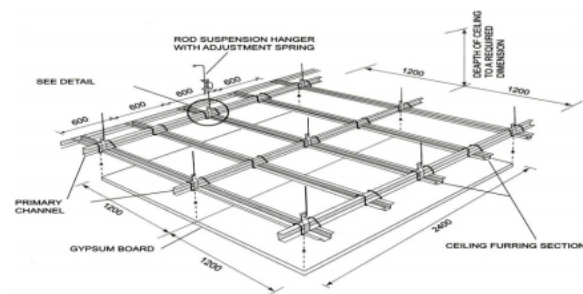

Application

With the advancement of China's modernization, light steel keel has found widespread application in hotels, terminals, bus stations, train stations, amusement parks, shopping malls, factories, office buildings, old building renovations, interior decoration settings and ceilings.
