IEC 61000-4-5; IEC 61000-4-6; IEC 61000-4-8; IEC 61000-4-11)

The device described above is tested by Shenzhen Anbotek Compliance Laboratory Limited to determine the maximum emission levels emanating from the device and the severe levels of the device can endure and its performance criterion. The measurement results are contained in this test report and Shenzhen Anbotek Compliance Laboratory Limited is assumed full of responsibility for the accuracy and completeness of these measurements. Also, this report shows that the EUT (Equipment Under Test) is technically compliant with the EN IEC 61326-1, EN IEC 61000-3-2, EN 61000-3-3 requirements.

This report applies to above tested sample only and shall not be reproduced in part without written approval of Shenzhen Anbotek Compliance Laboratory Limited.

1.7. Description of Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

FCC-Registration No.: 434132

Shenzhen Anbotek Compliance Laboratory Limited, EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications Commission. The acceptance letter from the FCC is maintained in our files. Registration No. 434132.

ISED-Registration No.: 8058A

Shenzhen Anbotek Compliance Laboratory Limited, EMC Laboratory has been registered and fully described in a report filed with the (ISED) Innovation, Science and Economic Development Canada. The acceptance letter from the ISED is maintained in our files. Registration 8058A.

Test Location

Shenzhen Anbotek Compliance Laboratory Limited.

1/F, Building D, Sogood Science and Technology Park, Sanwei community, Hangcheng Street, Bao'an District, Shenzhen, Guangdong, China.

1.8. EMS Performance Criteria**Performance criterion A**

The equipment shall continue to operate as intended during and after the test. No degradation of performance or loss of function is allowed below a performance level specified in the user documentation, when the equipment is used as intended. In the case of applying immunity tests with continuous electromagnetic phenomena, the performance level may be replaced by a permissible loss of performance which shall recover, v/ithout user intervention. A permissible loss of performance is allowed within the performance level only when this information is clearly provided to the end user via documentation, such as the product user manual. No change in the operating state is allowed nor is loss of data.

Performance criterion B

The equipment shall continue to operate as intended after the test. No degradation of performance or loss of function is allowed below a performance level specified in the user documentation, when the equipment is used as intended. During the test, the equipment performance level may be replaced by a permissible loss of performance if such loss of performance is detailed in the EMC test plan. A permissible loss of performance is allowed within the performance level only when this information is clearly provided to the end user via documentation, such as the product user manual. An unintended change of the operating state is allowed if self-recoverable. No loss of stored data is allowed.

Performance criterion C

Loss of function is allowed, provided the function is self-recoverable or can be restored by the operation of the controls. Recovery procedure shall be included in the user documentation. No permanent damage to the equipment is allowed.

2. Power Line Conducted Emission Test

2.1. Test Standard and Limit

Test Standard:	EN IEC 61326-1
----------------	----------------

☐ Limits for conducted emission at the AC mains power ports of Class A Group 1 equipment

Frequency range (MHz)	Rated power $\leq$ 20KVA		20KVA<Rated power $\leq$ 75KVA		75KVA<Rated power	
	QP(dBuV)	AVG(dBuV)	QP(dBuV)	AVG(dBuV)	QP(dBuV)	AVG(dBuV)
0.15 ~ 0.50	79	66	100	90	130	120
0.50 ~ 5.00	73	60	86	76	125	115
5.00 ~ 30.00	73	60	90 ~ 73*	80 ~ 60*	115	105

Remark:

- (1) The lower limit shall apply at the transition frequencies.
(2) The limit decreases linearly with the logarithm of the frequency in the range 5.00 MHz to 30.00 MHz.

☐ Limits for conducted emission at the DC power ports of Class A Group 1 equipment

Frequency range (MHz)	Rated power $\leq$ 20KVA		20KVA<Rated power $\leq$ 75KVA		75KVA<Rated power	
	QP(dBuV)	AVG(dBuV)	QP(dBuV)	AVG(dBuV)	QP(dBuV)	AVG(dBuV)
0.15 ~ 5.00	97 ~ 89*	84 ~ 76*	116 ~ 106*	106 ~ 96*	132 ~ 122*	122 ~ 112*
5.00 ~ 30.00	89	76	106 ~ 89*	96 ~ 76*	122 ~ 105*	112 ~ 92*

Remark:

The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 30.00 MHz.

☒ Limits for conducted emission at the AC mains power ports of Class B Group 1 equipment

Frequency range (MHz)	Limit (dBuV)	
	Quasi-peak	Average
0.15 ~ 0.50	66 ~ 56*	56 ~ 46*
0.50 ~ 5.00	56	46
5.00 ~ 30.00	60	50

Remark:

- (1) The lower limit shall apply at the transition frequencies.
(2) The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

☐ Limits for conducted emission at the DC power ports of Class B Group 1 equipment

Frequency range (MHz)	Limit (dBuV)	
	Quasi-peak	Average
0.15 ~ 0.50	84 ~ 74*	74 ~ 64*
0.50 ~ 30.00	74	64

Remark:

The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

☐ Limits for conducted emission at the AC mains power ports of Class B Group 2 equipment

Frequency range (MHz)	Limit (dBuV)	
	Quasi-peak	Average
0.15 ~ 0.50	66 ~ 56*	56 ~ 46*
0.50 ~ 5.00	56	46
5.00 ~ 30.00	60	50

Remark:

(1) The lower limit shall apply at the transition frequencies.

(2) The limit decreases linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz.

☐ Limits for conducted emission at the AC mains power ports of Class A Group 2 equipment

Frequency range (MHz)	Limit of Rated power ≤ 75KVA (dBuV)		Limit of Rated power > 75KVA (dBuV)	
	Quasi-peak	Average	Quasi-peak	Average
0.15 ~ 0.50	100	90	130	120
0.50 ~ 5.00	86	76	125	115
5.00 ~ 30.00	90 ~ 73*	80 ~ 60*	115	105

Remark:

(1) The lower limit shall apply at the transition frequencies.

(2) The limit decreases linearly with the logarithm of the frequency in the range 5.00 MHz to 30.00 MHz.

2.2. Test Setup

2.3. Test Procedure

The table-top EUT is placed on a non-conductive table 0.8 m above the horizontal ground reference plane, and the back of the EUT is 0.4 m away from the vertical ground reference plane, and at least 0.8 m from any other metal surface or ground plane. The floor-standing EUT is placed on an insulating support 0.1 m above the horizontal ground reference plane, at least 0.8 m away from other metal objects.

Connect EUT to the power mains through an LISN. Where the mains cable supplied by the manufacturer is longer than 1 m, the excess should be folded at the center into a bundle no longer than 0.4 m, so that its length is shortened to 1 m. All the peripherals are connecting to the other LISN.

The initial testing identified the frequency that has the highest disturbance relative to the limit while operating the EUT in typical modes of operation and cable positions in a test setup representative of typical system configuration.

The identification of the frequency of highest disturbance with respect to the limit was found by investigating disturbances at a number of significant frequencies. The probable frequency of maximum disturbance had been found and that the associated cable and EUT configuration and mode of operation had been identified.

Set the test-receiver to quasi peak detect function and average detect function, and to measure the conducted emissions values.

2.4. Test Results

3.3. Test Procedure

The table-top EUT is placed on a non-conductive table 0.8 m above the horizontal ground reference plane. The floor-standing EUT is placed on an insulating support 0.1 m above the horizontal ground reference plane.

The EUT was set 3 m away from the receiving antenna that was mounted on a non-conductive mast. The antenna can move up and down between 1 to 4 m to find out the maximum emission level(The height of the loop antenna is fixed at 1.5m).

The turntable can rotate 360 degree to determine the position of the maximum emission level.

The initial testing identified the frequency that has the highest disturbance relative to the limit while operating the EUT in typical modes of operation and cable positions in a test setup representative of typical system configuration.

The identification of the frequency of highest emission with respect to the limit was found by investigating emissions at a number of significant frequencies. The probable frequency of maximum emission had been found and that the associated cable and EUT configuration and mode of operation had been identified.

In the test frequency range of 0.15MHz-30MHz, the analytical bandwidth of the receiver is set to 9KHz, and in the test frequency range of 30MHz-1000MHz, the analytical bandwidth of the receiver is set to 120KHz.

6. Electrostatic Discharge Immunity Test

6.1. Test Specification

Test Standard :	EN IEC 61326-1	
Basic standard :	IEC 61000-4-2: 2008	
Performance criteria:	B	
Test Level :	± 8kV (Air Discharge)	± 4kV (Contact Discharge)

6.2. Test Setup

6.3. Test Procedure

a. In the case of air discharge testing, the climatic conditions shall be within the following ranges:

- Ambient temperature: 15°C to 35°C;
- Relative humidity: 30% to 60%;
- Atmospheric pressure: 86 kPa (860 mbar) to 106 kPa (1060 mbar)

b. In the case of contact discharges, the tip of the discharge electrode shall touch the EUT before the discharge switch is operated.

c. In the case of painted surface covering a conducting substrate, the following procedure shall be adopted: - If the coating is not declared to be an insulating coating by the equipment manufacturer, then the pointed tip of the generator shall penetrate the coating so as to make contact with the conducting substrate. - Coating declared as insulating by the manufacturer shall only be submitted to the air discharge. - The contact discharge test shall not be applied to such surfaces.

d. In the case of air discharges, the round discharge tip of the discharge electrode shall be approached as fast as possible (without causing mechanical damage) to touch the EUT. After each discharge, the ESD generator (discharge electrode) shall be removed from the EUT. The generator is then retriggered for a new single discharge. This procedure shall be repeated until the discharges are completed. In the case of an air discharge test, the discharge switch, which is used for contact discharge, shall be closed.

e. The test voltage shall be increased from the minimum to the selected test severity level, in order to determine any threshold of failure. The final test level should not exceed the product specification value in order to avoid damage to the equipment.

f. The test shall be performed with both air discharge and contact discharge. The test shall be performed with single discharges. On each pre-selected point at least 10 single discharges (in the most sensitive polarity) shall be applied. For the time interval between successive single discharges an initial value of 1 s is recommended. Longer intervals may be necessary to determine whether a system failure has occurred.

g. Ensure that the applied charge on the EUT has been dis-charged before next ESD pulse.

7.2. Test Setup

7.3. Test Procedure

The procedure defined in this part requires the generation of electromagnetic fields within which the test sample is placed and its operation observed. To generate fields that are useful for simulation of actual (field) conditions may require significant antenna drive power and the resultant high field strength levels. To comply with local regulations and to prevent biological hazards to the testing personnel, it is recommended that these tests be carried out in a shielded enclosure or semi-anechoic chamber.

a. The antenna is placed 3 m from the equipment. The required field strength is determined by placing the field strength meter(s) on top of or directly alongside the equipment under test and monitoring the field strength meter via a remote field strength indicator outside the enclosure while adjusting the continuous-wave to the antenna.

b. The test shall normally be performed with the generating antenna facing each side of the EUT. When equipment can be used in different orientations (i.e. vertical or horizontal) all sides shall be exposed to the field during the test. When technically justified, some EUTs can be tested by exposing fewer faces to the generating antenna. In other cases, as determined for example by the type and size of EUT or the frequencies of test, more than four azimuths may need to be exposed.

c. The polarization of the field generated by each antenna necessitates testing each selected side twice, once with the antenna positioned vertically and again with the antenna positioned horizontally.

d. The step size of the frequency is set to 1%. The dwell time at each frequency shall not be less than the time necessary for the EUT to be exercised and to be able to respond. However, the dwell time should not exceed 5 s at each of the frequencies during the scan.

11. Power Frequency Magnetic Field Immunity Test

11.1. Test Specification

Test Standard:	EN IEC 61326-1	
Basic Standard	IEC 61000-4-8: 2009	
Performance criteria	A	
Test level	☒ Basic Requirements	3 A/m
	☐ Requirements for industrial sites	30 A/m

11.2. Test Setup

11.3. Test Procedure

Table-top EUT is placed on a table that is 0.8 m height. Floor standing EUT is placed on a ground reference plane and insulated from it by an insulating support with a thickness of 0.1 m.

The EUT is placed in the middle of an induction coil. The proximity method is used when the EUT does not fit into the standard inductive coil

		☐ 0%, 250 periods for 50Hz, Criteria C	

12.2. Test Setup

12.3. Test Procedure

a. Where the equipment has a rated voltage the following shall apply:

- If the voltage range does not exceed 20% of the lower voltage specified for the rated voltage range, a single voltage within that range may be specified as a basis for test level specification.
- In all other cases, the test procedure shall be applied for both the lowest and highest voltages declared in the voltage range.

b. Test Conditions

- Select operated voltage and frequency of EUT - Test of interval: 10 sec.
- Level and duration: Sequence of 3 dips/interrupts.
- Voltage rise (and fall) time: 1.5 μ s.

c. Changes to occur at 0 degree crossover point of the voltage waveform.

CE Label

1. The CE conformity marking must consist of the initials 'CE' taking the following form:

If the CE marking is reduced or enlarged, the proportions given in the above graduated drawing must be respected.

2. The CE marking must have a height of at least 5 mm except where this is not possible on account of the nature of the apparatus.
3. The CE marking must be affixed to the product or to its data plate. Additionally it must be affixed to the packaging, if any, and to the accompanying documents.
4. The CE marking must be affixed visibly, legibly and indelibly.

It must have the same height as the initials 'CE'.
